

Instructions for cleaning your Implant Healing caps

- Stop using the salt mouthwashes and stop using the Corsodyl as a mouthwash
- Clean your natural teeth with toothbrush and toothpaste
- Spit out the toothpaste and clean the metal healing caps of the implants using the soft red brush dipped in Corsodyl. Just spit the Corsodyl out, do not rinse out. Do this for the next 7 to 10 days, morning and night.
- After this time the gum will have healed around the implants. Throw the red toothbrush away. Start cleaning the metal implant healing caps with the small “interspace” brush dipped in Corsodyl. You can be quite firm with this brush, the aim being to push the bristles between the metal cap and the gum tissue. Again, spit out the Corsodyl, do not rinse out. Carry on with this regimen until your implant treatment is finished.
